

***Amendments to the Claims***

The listing of claims will replace all prior versions, and listings of claims in the application.

1. (Original) A method for correlating an encoded data word ( $X_0-X_{M-1}$ ) with encoding coefficients ( $C_0-C_{M-1}$ ), wherein each of ( $X_0-X_{M-1}$ ) is represented by one or more bits and each said coefficient is represented by one or more bits, wherein each said coefficient has  $k$  possible states, wherein  $M$  is greater than 1, comprising:

- (1) receiving the encoded data word ( $X_0-X_{M-1}$ );
- (2) multiplying  $X_0$  with states  $C_{0(0)}$  through  $C_{0(k-1)}$  of said coefficient  $C_0$ , thereby generating results  $X_0C_{0(0)}$  through  $X_0C_{0(k-1)}$ ;
- (3) repeating step (1) for data bits ( $X_1-X_{M-1}$ ) and corresponding said coefficients ( $C_1-C_{M-1}$ ), respectively;
- (4) grouping said results of steps (2) and (3) into  $N$  groups and summing combinations within each of said  $N$  groups, thereby generating a first layer of correlation results;
- (5) grouping the results of step (4) and summing combinations of results within each group to generate one or more additional layers of results, and repeating this process until a final layer of results includes a correlation output for states of the set of coefficients ( $C_0-C_{M-1}$ );
- (6) comparing magnitudes output of said correlation outputs, thereby identifying a most likely code encoded on said data word; and
- (7) outputting the most likely code.

2. (Original) The method according to claim 1, wherein (4) and (5) comprise omitting summations that would result in invalid combinations of the encoding coefficients ( $C_0-C_{M-1}$ ).

3. (Original) The method according to claim 1, further comprising performing steps (1) through (7) using substantially the same hardware for in-phase and quadrature phase components of the data word ( $X_0-X_{M-1}$ ).

4. (Original) The method according to claim 1, wherein said coefficients ( $C_0-C_{M-1}$ ) represent real numbers.

5. (Original) The method according to claim 1, wherein said coefficients ( $C_0-C_{M-1}$ ) represent complex numbers.

6. (Original) The method according to claim 1, wherein each said coefficient ( $C_0-C_{M-1}$ ) is represented by a single bit.

7. (Original) The method according to claim 1, wherein each said coefficient ( $C_0-C_{M-1}$ ) is represented by multiple bits.

8. (Original) The method according to claim 1, wherein said code patterns ( $C_0-C_{M-1}$ ) represent a cyclic code keying ("CCK") code set substantially in accordance with IEEE 802.11 WLAN standard.

9. (Original) The method according to claim 8, wherein:  
M equals 8;  
each said coefficient ( $C_0-C_{M-1}$ ) has two states, plus and minus;  
N equals 4;  
said first level of results comprises at least a portion of the following;  
 $(X_0C_0 + X_1C_1)$ ,  $(X_0(-C_0)+X_1C_1)$ ,  $(X_0C_0+X_1(-C_1))$ ,  $(X_0(-C_0) + X_1(-C_1))$ ,  $(X_2C_2 + X_3C_3)$ ,  $(X_2(-C_2)+X_3C_3)$ ,  $(X_2C_2+X_3(-C_3))$ ,  $(X_2(-C_2)+(X_3(-C_3)))$ ,  $(X_4C_4 + X_5C_5)$ ,  $(X_4(-C_4)+X_5C_5)$ ,  $(X_4C_4+X_5(-C_5))$ ,  $(X_4(-C_4) + X_5(-C_5))$ ,  $(X_6C_6 + X_7C_7)$ ,  $(X_6(-C_6)+X_7C_7)$ ,  $(X_6C_6+X_7(-C_7))$ , and  $(X_6(-C_6)+(X_7(-C_7)))$ ; and  
wherein said second level of results comprises at least a portion of the following:

$((X_0C_0 + X_1C_1) + (X_2C_2 + X_3C_3))$ , (i.e.,  $B_0$ ),

$((X_0C_0 + X_1C_1) + (X_2(-C_2)+X_3C_3))$ , (i.e., B<sub>1</sub>),

$((X_0C_0 + X_1C_1) + (X_2C_2+X_3(-C_3))$ , (i.e., B<sub>2</sub>),

$((X_0C_0 + X_1C_1) + (X_2(-C_2)+(X_3(-C_3))$ , (i.e., B<sub>3</sub>),

$((X_0(-C_0)+X_1C_1)+ (X_2C_2 + X_3C_3))$ , (i.e., B<sub>4</sub>)

$((X_0(-C_0)+X_1C_1) + (X_2(-C_2)+X_3C_3))$ , (i.e., B<sub>5</sub>),

$((X_0(-C_0)+X_1C_1) + (X_2C_2+X_3(-C_3))$ , (i.e., B<sub>6</sub>),

$((X_0(-C_0)+X_1C_1) + (X_2(-C_2)+(X_3(-C_3))$ , (i.e., B<sub>7</sub>),

$((X_0C_0+X_1(-C_1)) + (X_2C_2 + X_3C_3))$ , (i.e., B<sub>8</sub>)

$((X_0C_0+X_1(-C_1)) + (X_2(-C_2)+X_3C_3))$ , (i.e., B<sub>9</sub>),

$((X_0C_0+X_1(-C_1)) + (X_2C_2+X_3(-C_3))$ , (i.e., B<sub>10</sub>),

$((X_0C_0+X_1(-C_1)) + (X_2(-C_2)+(X_3(-C_3))$ , (i.e., B<sub>11</sub>),

$((X_0(-C_0) + X_1(-C_1)) + (X_2C_2 + X_3C_3))$ , (i.e., B<sub>12</sub>)

$((X_0(-C_0) + X_1(-C_1)) + (X_2(-C_2)+X_3C_3))$ , (i.e., B<sub>13</sub>),

$((X_0(-C_0) + X_1(-C_1)) + (X_2C_2+X_3(-C_3))$ , (i.e., B<sub>14</sub>),

$((X_0(-C_0) + X_1(-C_1)) + (X_2(-C_2)+(X_3(-C_3))$ , (i.e., B<sub>15</sub>),

$((X_4C_4 + X_5C_5) + (X_6C_6 + X_7C_7))$ , (i.e., B<sub>16</sub>),

$((X_4C_4 + X_5C_5) + (X_6(-C_6)+X_7C_7))$ , (i.e., B<sub>20</sub>),

$((X_4C_4 + X_5C_5) + (X_6C_6+X_7(-C_7))$ , (i.e., B<sub>24</sub>),

$((X_4C_4 + X_5C_5) + (X_6(-C_6)+(X_7(-C_7))$ , (i.e., B<sub>28</sub>),

$((X_4(-C_4)+X_5C_5)+ (X_6C_6 + X_7C_7))$ , (i.e., B<sub>17</sub>)

$((X_4(-C_4)+X_5C_5) + (X_6(-C_6)+X_7C_7))$ , (i.e., B<sub>21</sub>),

$((X_4(-C_4)+X_5C_5) + (X_6C_6+X_7(-C_7))$ , (i.e., B<sub>25</sub>),

$((X_4(-C_4)+X_5C_5) + (X_6(-C_6)+(X_7(-C_7))$ , (i.e., B<sub>29</sub>),

$((X_4C_4+X_5(-C_5)) + (X_6C_6 + X_7C_7))$ , (i.e., B<sub>18</sub>)

$((X_4C_4+X_5(-C_5)) + (X_6(-C_6)+X_7C_7))$ , (i.e., B<sub>22</sub>),

$((X_4C_4+X_5(-C_5)) + (X_6C_6+X_7(-C_7))$ , (i.e., B<sub>26</sub>),

$((X_4C_4 + X_5(-C_5)) + (X_6(-C_6) + (X_7(-C_7))),$  (i.e.,  $B_{30}),$

$((X_4(-C_4) + X_5(-C_5)) + (X_6C_6 + X_7C_7)),$  (i.e.,  $19)$

$((X_4(-C_4) + X_5(-C_5)) + (X_6(-C_6) + X_7C_7)),$  (i.e.,  $B_{23}),$

$((X_4(-C_4) + X_5(-C_5)) + (X_6C_6 + X_7(-C_7))),$  (i.e.,  $B_{27}),$

$((X_4(-C_4) + X_5(-C_5)) + (X_6(-C_6) + (X_7(-C_7))),$  (i.e.,  $B_{31}).$

10. (Original) The method according to claim 9, wherein said second level of results omits one or more of  $B_0$  through  $B_{31}.$

11. (Original) The method according to claim 9, wherein said second level of results omits one or more of  $B_0$  through  $B_{31}$  that represent invalid combinations of one or more of  $(C_0-C_{M-1}).$

12. (Original) The method according to claim 9, wherein said second level of results omits one or more of  $B_0$  through  $B_{31}$  where the omitted combination(s) would be redundant based on said CCK code specification.

13. (Original) The method according to claim 9, wherein said second level of results omits  $B_{24}$  through  $B_{31}.$

14. (Original) The method according to claim 13, wherein said final level of results comprises:

$(B_0 + B_{19}), (B_0 + B_{21}), (B_1 + B_{20}), (B_1 + B_{18}), (B_1 + B_{23}), (B_2 + B_{20}), (B_2 + B_{17}), (B_2 + B_{23}), (B_3 + B_{16}), (B_3 + B_{22}), (B_4 + B_{17}), (B_4 + B_{18}), (B_4 + B_{23}), (B_5 + B_{16}), (B_5 + B_{22}), (B_6 + B_{21}), (B_6 + B_{19}), (B_7 + B_{20}), (B_7 + B_{17}), (B_7 + B_{18}), (B_8 + B_{20}), (B_8 + B_{17}), (B_8 + B_{18}), (B_9 + B_{21}), (B_9 + B_{19}), (B_{10} + B_{16}), (B_{10} + B_{22}), (B_{11} + B_{17}), (B_{11} + B_{18}), (B_{11} + B_{23}), (B_{12} + B_{16}), (B_{12} + B_{22}), (B_{13} + B_{20}), (B_{13} + B_{17}), (B_{13} + B_{23}), (B_{14} + B_{20}), (B_{14} + B_{18}), (B_{14} + B_{23}), (B_{15} + B_{21}), \text{ and } (B_{15} + B_{19}).$

15. (Original) The method according to claim 13, wherein said final level of results consists of:

(B<sub>0</sub> + B<sub>19</sub>), (B<sub>0</sub> + B<sub>21</sub>), (B<sub>1</sub> + B<sub>20</sub>), (B<sub>1</sub> + B<sub>18</sub>), (B<sub>1</sub> + B<sub>23</sub>), (B<sub>2</sub> + B<sub>20</sub>), (B<sub>2</sub> + B<sub>17</sub>), (B<sub>2</sub> + B<sub>23</sub>), (B<sub>3</sub> + B<sub>16</sub>), (B<sub>3</sub> + B<sub>22</sub>), (B<sub>4</sub> + B<sub>17</sub>), (B<sub>4</sub> + B<sub>18</sub>), (B<sub>4</sub> + B<sub>23</sub>), (B<sub>5</sub> + B<sub>16</sub>), (B<sub>5</sub> + B<sub>22</sub>), (B<sub>6</sub> + B<sub>21</sub>), (B<sub>6</sub> + B<sub>19</sub>), (B<sub>7</sub> + B<sub>20</sub>), (B<sub>7</sub> + B<sub>17</sub>), (B<sub>7</sub> + B<sub>18</sub>), (B<sub>8</sub> + B<sub>20</sub>), (B<sub>8</sub> + B<sub>17</sub>), (B<sub>8</sub> + B<sub>18</sub>), (B<sub>9</sub> + B<sub>21</sub>), (B<sub>9</sub> + B<sub>19</sub>), (B<sub>10</sub> + B<sub>16</sub>), (B<sub>10</sub> + B<sub>22</sub>), (B<sub>11</sub> + B<sub>17</sub>), (B<sub>11</sub> + B<sub>18</sub>), (B<sub>11</sub> + B<sub>23</sub>), (B<sub>12</sub> + B<sub>16</sub>), (B<sub>12</sub> + B<sub>22</sub>), (B<sub>13</sub> + B<sub>20</sub>), (B<sub>13</sub> + B<sub>17</sub>), (B<sub>13</sub> + B<sub>23</sub>), (B<sub>14</sub> + B<sub>20</sub>), (B<sub>14</sub> + B<sub>18</sub>), (B<sub>14</sub> + B<sub>23</sub>), (B<sub>15</sub> + B<sub>21</sub>), and (B<sub>15</sub> + B<sub>19</sub>).

16. (Original) The method according to claim 9, wherein said final level of results omits one or more possible combinations of B<sub>0</sub> through B<sub>31</sub>.

17. (Original) The method according to claim 9, wherein said final level of results omits one or more combinations of B<sub>0</sub> through B<sub>31</sub> that represent invalid combinations of one or more of (C<sub>0</sub>-C<sub>M-1</sub>).

18. (Original) The method according to claim 9, wherein said final level of results omits one or more combinations of B<sub>0</sub> through B<sub>31</sub> where the omitted combination(s) would be redundant based on a code specification.

19. (Original) The method according to claim 9, wherein said final level of results omits one or more combinations B<sub>24</sub> through B<sub>31</sub> where the omitted combination(s) would be invalid based on a code specification.

20. (Original) The method according to claim 1, further comprising performing an equalization process during one or more of steps (4) and (5).

21. (Original) The method according to claim 1, further comprising performing an MLSE process during one or more of steps (4) and (5).

22. (Original) The method according to claim 1, further comprising performing an adaptive process during one or more of steps (4) and (5).

23. (Original) The method according to claim 1, further comprising performing an adaptive equalization process during one or more of steps (4) and (5).

24. (Original) The method according to claim 1, wherein one or more of ( $C_0-C_{M-1}$ ) are constants.

25. (Original) The method according to claim 1, wherein one or more of ( $C_0-C_{M-1}$ ) are variable.

26. (Original) The method according to claim 1, wherein steps (4) and (5) are implemented in accordance with:

$$N = \frac{n!}{r!(n-r)!} - L$$

wherein:

n represents a number of summer inputs;

r represents a number of summing inputs per kernal; and

L represents a number of invalid combinations

27. (Currently Amended) A system for correlating an encoded data word ( $X_0-X_{M-1}$ ) with encoding coefficients ( $C_0-C_{M-1}$ ), wherein each of ( $X_0-X_{M-1}$ ) is represented by one or more bits and each said coefficient is represented by one or more bits, wherein each said coefficient has k possible states, wherein M is greater than 1, comprising:

inputs for each of ( $X_0-X_{M-1}$ );

a multiplier coupled to each said input;

N summers, each coupled to a different group of outputs of said multipliers, whereby outputs of said N summers form a first layer of correlation results;

one or more additional layers of summers, each said additional layer of summers coupled to outputs of a previous layer of correlation results, said one or more additional layers of summers including a final layer of summers having a final layer of results including a separate correlation output for each possible state of the complete set of coefficients ( $C_0-C_{M-1}$ ); and

a magnitude comparator coupled to said final layer of results; and  
means for selecting a state of the complete set of coefficients ( $C_0-C_{M-1}$ ) associated with a maximum correlation output.

28. (Original) A system for correlating an encoded data word ( $X_0-X_{M-1}$ ) with encoding coefficients ( $C_0-C_{M-1}$ ), wherein each of ( $X_0-X_{M-1}$ ) is represented by one or more bits and each said coefficient is represented by one or more bits, wherein each said coefficient has  $k$  possible states, wherein  $M$  is greater than 1, comprising:

means for multiplying  $X_0$  with states  $C_{0(0)}$  through  $C_{0(k-1)}$  of said coefficient  $C_0$ , thereby generating results  $X_0C_{0(0)}$  through  $X_0C_{0(k-1)}$ ;

wherein said means for multiply includes means for multiplying  $X_1-X_{M-1}$  with corresponding coefficients ( $C_1-C_{M-1}$ ), respectively;

first means for grouping results of said means for multiplying into  $N$  groups and for summing combinations within each of said  $N$  groups, thereby generating a first layer of correlation results;

second means for grouping results of said first means for grouping and for summing combinations of results within each group to generate one or more additional layers of results, and repeating this process until a final layer of results includes a correlation output for states of said set of coefficients ( $C_0-C_{M-1}$ ); and

means for comparing magnitudes output of said correlation outputs, thereby identifying a most likely code encoded on said data word.

29. (Original) A method for parallel correlation detection, comprising the steps of:

(1) receiving noisy input samples  $X_0, X_1, X_2, X_3, X_4, X_5, X_6$ , and  $X_7$  from which a code is to be extracted;

(2) forming four sets of sample pairs  $(X_0, X_1)$ ,  $(X_2, X_3)$ ,  $(X_4, X_5)$ , and  $(X_6, X_7)$  from said input samples;

(3) forming four correlation kernels  $(X_i C_i + X_j C_j)$ ,  $(-X_i C_i + X_j C_j)$ ,  $(X_i C_i - X_j C_j)$ , and  $(-X_i C_i - X_j C_j)$  for each set of sample pairs formed in step (2), wherein  $X_i$  and  $X_j$  represent one of the four sample pairs formed in step (2) and wherein  $C_i$  and  $C_j$  represent predetermined weighting factors;

(4) combining the correlation kernels formed in step (3) to form a fast correlation transform trellis with sixty-four eight-tuple options;

(5) using the sixty-four eight-tuple options formed in step (4) to extract the code from the input samples received in step (1); and

(6) outputting the extracted code.

30. (Currently Amended) A system for parallel correlation detection, comprising:

a first module that receives noisy input samples  $X_0, X_1, X_2, X_3, X_4, X_5, X_6$ , and  $X_7$  from which a code must be extracted;

a second module that forms four sets of sample pairs  $(X_0, X_1)$ ,  $(X_2, X_3)$ ,  $(X_4, X_5)$ , and  $(X_6, X_7)$  from said input samples;

a third module that forms four correlation kernels  $(X_i C_i + X_j C_j)$ ,  $(-X_i C_i + X_j C_j)$ ,  $(X_i C_i - X_j C_j)$ , and  $(-X_i C_i - X_j C_j)$  for each set of sample pairs formed in step (2) said second module, wherein  $X_i$  and  $X_j$  represent one of the four sample pairs formed in step (2) said second module and wherein  $C_i$  and  $C_j$  represent predetermined weighting factors; and

a fourth module that combines the correlation kernels formed in step (3) said third module to form a fast correlation transform trellis with sixty-four eight-tuple options; and

a fifth module that compares magnitudes of outputs of said fast correlation transform trellis to identify a most likely code encoded in said noisy input samples.

31. (Original) A method for correlating an encoded data word  $(X_0-X_{M-1})$  with encoding coefficients  $(C_0-C_{M-1})$ , wherein each of  $(X_0-X_{M-1})$  is represented by one or

more bits and each said coefficient is represented by one or more bits, wherein each said coefficient has k possible states, wherein M is greater than 1, comprising:

- (1) receiving the encoded data word ( $X_0-X_{M-1}$ );
- (2) multiplying  $X_0$  with states of said coefficient  $C_0$ ;
- (3) repeating step (2) for data bits ( $X_1-X_{M-1}$ ) and corresponding said coefficients, respectively;
- (4) grouping said results of steps (2) and (3) into N groups and summing combinations within each of said N groups, thereby generating a first layer of correlation results;
- (5) grouping the results of step (4) and summing combinations of results within each group to generate one or more additional layers of results, and repeating this process until a final layer of results includes a correlation output for each possible state of the set of coefficients;
- (6) comparing magnitudes output of said correlation outputs, thereby identifying a most likely code encoded on said data word; and
- (7) outputting the most likely code.

32. (Original) A method for parallel correlation detection, comprising the steps of:

- (1) receiving noisy input samples from which a code must be extracted;
- (2) forming at least four sets of sample pairs from said input samples;
- (3) forming at least four correlation kernels for each set of sample pairs formed in step (2), wherein  $X_i$  and  $X_j$  represent one of the sample pairs formed in step (2) and wherein  $C_i$  and  $C_j$  represent predetermined weighting factors;
- (4) combining the correlation kernels formed in step (3) to form a fast correlation transform trellis with at least sixty-four eight-tuple options;
- (5) using the at least sixty-four eight-tuple options formed in step (4) to extract the code from the input samples received in step (1); and
- (6) outputting the extracted code.
